Mod : logicheil freewareQ: Why are these linear functions convex? Why are
these linear functions convex? I know that if $f(x)=x$ and
 $g(x)=ax^2+bx$ then $f(x)+g(x)=x^2+(a+b)x+\frac{ab}{a+b}$ is
convex in x . I'm not able to see if the above functions are convex in any
other way. A: hint We have $f(x)+g(x)=2x+a$ and by convexity of $f(x)$
the function in the r.h.s. is convex. Can you conclude? Q: Q: Advice for
creating a C++ class library for Qt5 I have a self-made class library written
in C++
